

Exam Questions CSSLP

Certified Information Systems Security Professional

<https://www.2passeasy.com/dumps/CSSLP/>

NEW QUESTION 1

In which of the following types of tests are the disaster recovery checklists distributed to the members of disaster recovery team and asked to review the assigned checklist?

- A. Parallel test
- B. Simulation test
- C. Full-interruption test
- D. Checklist test

Answer: D

Explanation:

A checklist test is a test in which the disaster recovery checklists are distributed to the members of the disaster recovery team. All members are asked to review the assigned checklist. The checklist test is a simple test and it is easy to conduct this test. It allows to accomplish the following three goals: It ensures that the employees are aware of their responsibilities and they have the refreshed knowledge. It provides an individual with an opportunity to review the checklists for obsolete information and update any items that require modification during the changes in the organization. It ensures that the assigned members of disaster recovery team are still working for the organization. Answer B is incorrect. A simulation test is a method used to test the disaster recovery plans. It operates just like a structured walk- through test. In the simulation test, the members of a disaster recovery team present with a disaster scenario and then, discuss on appropriate responses. These suggested responses are measured and some of them are taken by the team. The range of the simulation test should be defined carefully for avoiding excessive disruption of normal business activities. Answer A is incorrect. A parallel test includes the next level in the testing procedure, and relocates the employees to an alternate recovery site and implements site activation procedures. These employees present with their disaster recovery responsibilities as they would for an actual disaster. The disaster recovery sites have full responsibilities to conduct the day-to-day organization's business. Answer C is incorrect. A full-interruption test includes the operations that shut down at the primary site and are shifted to the recovery site according to the disaster recovery plan. It operates just like a parallel test. The full-interruption test is very expensive and difficult to arrange. Sometimes, it causes a major disruption of operations if the test fails.

NEW QUESTION 2

Which of the following is an example of over-the-air (OTA) provisioning in digital rights management?

- A. Use of shared secrets to initiate or rebuild trust.
- B. Use of software to meet the deployment goals.
- C. Use of concealment to avoid tampering attacks.
- D. Use of device properties for unique identification.

Answer: A

Explanation:

Over- the- air provisioning is a mechanism to deploy MIDlet suites over a network. It is a method of distributing MIDlet suites. MIDlet suite providers install their MIDlet suites on Web servers and provide a hypertext link for downloading. A user can use this link to download the MIDlet suite either through the Internet microbrowser or through WAP on his device. Over-the-air provisioning is required for end-to-end encryption or other security purposes in order to deliver copyrighted software to a mobile device. For example, use of shared secrets to initiate or rebuild trust. Answer D and C are incorrect. The use of device properties for unique identification and the use of concealment to avoid tampering attacks are the security challenges in digital rights management (DRM). Answer B is incorrect. The use of software and hardware to meet the deployment goals is a distracter.

NEW QUESTION 3

Which of the following access control models are used in the commercial sector? Each correct answer represents a complete solution. Choose two.

- A. Biba model
- B. Clark-Biba model
- C. Clark-Wilson model
- D. Bell-LaPadula model

Answer: AC

Explanation:

The Biba and Clark-Wilson access control models are used in the commercial sector. The Biba model is a formal state transition system of computer security policy that describes a set of access control rules designed to ensure data integrity. Data and subjects are grouped into ordered levels of integrity. The model is designed so that subjects may not corrupt data in a level ranked higher than the subject, or be corrupted by data from a lower level than the subject. The Clark-Wilson security model provides a foundation for specifying and analyzing an integrity policy for a computing system. Answer D is incorrect. The Bell-LaPadula access control model is mainly used in military systems. Answer B is incorrect. There is no such access control model as Clark-Biba.

NEW QUESTION 4

Which of the following types of redundancy prevents attacks in which an attacker can get physical control of a machine, insert unauthorized software, and alter data?

- A. Data redundancy
- B. Hardware redundancy
- C. Process redundancy
- D. Application redundancy

Answer: C

Explanation:

Process redundancy permits software to run simultaneously on multiple geographically distributed locations, with voting on results. It prevents attacks in which an attacker can get physical control of a machine, insert unauthorized software, and alter data.

NEW QUESTION 5

Which of the following cryptographic system services ensures that information will not be disclosed to any unauthorized person on a local network?

- A. Authentication
- B. Integrity
- C. Non-repudiation
- D. Confidentiality

Answer: D

Explanation:

The confidentiality service of a cryptographic system ensures that information will not be disclosed to any unauthorized person on a local network.

NEW QUESTION 6

Which of the following methods determines the principle name of the current user and returns the `java.security.Principal` object in the `HttpServletRequest` interface?

- A. `getUserPrincipal()`
- B. `isUserInRole()`
- C. `getRemoteUser()`
- D. `getCallerPrincipal()`

Answer: A

Explanation:

The `getUserPrincipal()` method determines the principle name of the current user and returns the `java.security.Principal` object. The `java.security.Principal` object contains the remote user name. The value of the `getUserPrincipal()` method returns null if no user is authenticated. Answer C is incorrect. The `getRemoteUser()` method returns the user name that is used for the client authentication. The value of the `getRemoteUser()` method returns null if no user is authenticated. Answer B is incorrect. The `isUserInRole()` method determines whether the remote user is granted a specified user role. The value of the `isUserInRole()` method returns true if the remote user is granted the specified user role; otherwise it returns false. Answer D is incorrect. The `getCallerPrincipal()` method is used to identify a caller using a `java.security.Principal` object. It is not used in the `HttpServletRequest` interface.

NEW QUESTION 7

What are the various activities performed in the planning phase of the Software Assurance Acquisition process? Each correct answer represents a complete solution. Choose all that apply.

- A. Develop software requirements.
- B. Implement change control procedures.
- C. Develop evaluation criteria and evaluation plan.
- D. Create acquisition strategy.

Answer: ACD

Explanation:

The various activities performed in the planning phase of the Software Assurance Acquisition process are as follows: Determine software product or service requirements. Identify associated risks. Develop software requirements. Create acquisition strategy. Develop evaluation criteria and evaluation plan. Define development and use of SwA due diligence questionnaires. Answer B is incorrect. This activity is performed in the monitoring and acceptance phase of the Software Assurance acquisition process.

NEW QUESTION 8

Which of the following organizations assists the President in overseeing the preparation of the federal budget and to supervise its administration in Executive Branch agencies?

- A. OMB
- B. NIST
- C. NSA/CSS
- D. DCAA

Answer: A

Explanation:

The Office of Management and Budget (OMB) is a Cabinet-level office, and is the largest office within the Executive Office of the President (EOP) of the United States. The current OMB Director is Peter Orszag and was appointed by President Barack Obama. The OMB's predominant mission is to assist the President in overseeing the preparation of the federal budget and to supervise its administration in Executive Branch agencies. In helping to formulate the President's spending plans, the OMB evaluates the effectiveness of agency programs, policies, and procedures, assesses competing funding demands among agencies, and sets funding priorities. The OMB ensures that agency reports, rules, testimony, and proposed legislation are consistent with the President's Budget and with Administration policies.

Answer D is incorrect. The DCAA has the aim to monitor contractor costs and perform contractor audits. Answer C is incorrect. The National Security Agency/Central Security Service (NSA/CSS) is a crypto-logic intelligence agency of the United States government. It is administered as part of the United States Department of Defense. NSA is responsible for the collection and analysis of foreign communications and foreign signals intelligence, which involves cryptanalysis. NSA is also responsible for protecting U.S. government communications and information systems from similar agencies elsewhere, which involves cryptography. NSA is a key component of the U.S. Intelligence Community, which is headed by the Director of National Intelligence. The Central Security Service is a co-located agency created to coordinate intelligence activities and co-operation between NSA and U.S. military cryptanalysis agencies. NSA's work is limited to communications intelligence. It does not perform field or human intelligence activities. Answer B is incorrect. The National Institute of Standards and Technology (NIST), known between 1901 and 1988 as the National Bureau of Standards (NBS), is a measurement standards laboratory which is a non-regulatory agency of the United States Department of Commerce. The institute's official mission is to promote U.S. innovation and industrial competitiveness by advancing measurement science, standards, and technology in ways that enhance economic security and improve quality of life.

NEW QUESTION 9

In which of the following processes are experienced personnel and software tools used to investigate, resolve, and handle process deviation, malformed data, infrastructure, or connectivity issues?

- A. Risk Management
- B. Exception management
- C. Configuration Management
- D. Change Management

Answer: B

Explanation:

Exception management is a process in which experienced personnel and software tools are used to investigate, resolve, and handle process deviation, malformed data, infrastructure or connectivity issues. It increases the efficiency of business processes and contributes in the progress of business. Answer C is incorrect. Configuration Management (CM) is an Information Technology Infrastructure Library (ITIL) IT Service Management (ITSM) process. It tracks all of the individual Configuration Items (CI) in an IT system, which may be as simple as a single server, or as complex as the entire IT department. In large organizations a configuration manager may be appointed to oversee and manage the CM process. Answer A is incorrect. Risk Management is used to identify, assess, and control risks. It includes analyzing the value of assets to the business, identifying threats to those assets, and evaluating how vulnerable each asset is to those threats. Risk Management is part of Service Design and the owner of the Risk Management is the Risk Manager. Risks are addressed within several processes in ITIL V3; however, there is no dedicated Risk Management process. ITIL V3 calls for "coordinated risk assessment exercises", so at IT Process Maps we decided to assign clear responsibilities for managing risks. Answer D is incorrect. Change Management is used to ensure that standardized methods and procedures are used for efficient handling of all changes. A change is "an event that results in a new status of one or more configuration items (CI's)" approved by management, cost effective, enhances business process changes (fixes) - with a minimum risk to IT infrastructure. The main aims of Change Management are as follows: Minimal disruption of services Reduction in back-out activities Economic utilization of resources involved in the change

NEW QUESTION 10

You work as a Security Manager for Tech Perfect Inc. In the organization, Syslog is used for computer system management and security auditing, as well as for generalized informational, analysis, and debugging messages. You want to prevent a denial of service (DoS) for the Syslog server and the loss of Syslog messages from other sources. What will you do to accomplish the task?

- A. Use a different message format other than Syslog in order to accept data.
- B. Enable the storage of log entries in both traditional Syslog files and a database.
- C. Limit the number of Syslog messages or TCP connections from a specific source for a certain time period.
- D. Encrypt rotated log files automatically using third-party or OS mechanisms.

Answer: C

Explanation:

In order to accomplish the task, you should limit the number of Syslog messages or TCP connections from a specific source for a certain time period. This will prevent a denial of service (DoS) for the Syslog server and the loss of Syslog messages from other sources. Answer D is incorrect. You can encrypt rotated log files automatically using third-party or OS mechanisms to protect data confidentiality. Answer A is incorrect. You can use a different message format other than Syslog in order to accept data for aggregating data from hosts that do not support Syslog. Answer B is incorrect. You can enable the storage of log entries in both traditional Syslog files and a database for creating a database storage for logs.

NEW QUESTION 10

Which of the following governance bodies directs and coordinates implementations of the information security program?

- A. Chief Information Security Officer
- B. Information Security Steering Committee
- C. Business Unit Manager
- D. Senior Management

Answer: A

Explanation:

Chief Information Security Officer directs and coordinates implementations of the information security program. The governance roles and responsibilities are mentioned below in the table:

Governance Body	Membership	Responsibilities
Information Security Steering Committee	CFO, CEO, COO, CTO, VP Business units chaired by CISO	It establishes and supports security programs
Senior Management	C-level, unit VPs and senior VPs	It provides management, operational and technical controls to satisfy security requirements.
Chief Information Security Officer	CISO and staff	It directs and coordinates implementations of information security program.
Business Unit Managers	Department heads and supervisors	They Classify and establish requirements for safeguarding information assets.

NEW QUESTION 15

Which of the following coding practices are helpful in simplifying code? Each correct answer represents a complete solution. Choose all that apply.

- A. Programmers should use multiple small and simple functions rather than a single complex function.
- B. Software should avoid ambiguities and hidden assumptions, recursions, and GoTo statement
- C. Programmers should implement high-consequence functions in minimum required lines of code and follow proper coding standards.
- D. Processes should have multiple entry and exit points.

Answer: ABC

Explanation:

The various coding practices that are helpful in simplifying the code are as follows: Programmers should implement high-consequence functions in minimum required lines of code and follow the proper coding standards. Software should implement the functions that are defined in the software specification. Software should avoid ambiguities and hidden assumptions, recursion, and GoTo statements. Programmers should use multiple small and simple functions rather than a complex function. The processes should have only one entry point and minimum exit points. Interdependencies should be minimum so that a process module or component can be disabled when it is not needed, or replaced when it is found insecure or a better alternative is available, without disturbing the software operations. Programmers should use object-oriented techniques to keep the code simple and small. Some of the object-oriented techniques are object inheritance, encapsulation, and polymorphism. Answer D is incorrect. Processes should have only one entry point and the minimum number of exit points.

NEW QUESTION 20

Which of the following NIST Special Publication documents provides a guideline on network security testing?

- A. NIST SP 800-42
- B. NIST SP 800-53A
- C. NIST SP 800-60
- D. NIST SP 800-53
- E. NIST SP 800-37
- F. NIST SP 800-59

Answer: A

Explanation:

NIST SP 800-42 provides a guideline on network security testing. Answer E, D, B, F, and C are incorrect. NIST has developed a suite of documents for conducting Certification & Accreditation (C&A). These documents are as follows: NIST Special Publication 800-37: This document is a guide for the security certification and accreditation of Federal Information Systems. NIST Special Publication 800-53: This document provides a guideline for security controls for Federal Information Systems. NIST Special Publication 800-53A. This document consists of techniques and procedures for verifying the effectiveness of security controls in Federal Information System. NIST Special Publication 800-59: This document is a guideline for identifying an information system as a National Security System. NIST Special Publication 800-60: This document is a guide for mapping types of information and information systems to security objectives and risk levels.

NEW QUESTION 21

What component of the change management system is responsible for evaluating, testing, and documenting changes created to the project scope?

- A. Project Management Information System
- B. Integrated Change Control
- C. Configuration Management System
- D. Scope Verification

Answer: C

Explanation:

The change management system is comprised of several components that guide the change request through the process. When a change request is made that will affect the project scope. The Configuration Management System evaluates the change request and documents the features and functions of the change on the project scope.

NEW QUESTION 22

An asset with a value of \$600,000 is subject to a successful malicious attack threat twice a year. The asset has an exposure of 30 percent to the threat. What will be the annualized loss expectancy?

- A. \$360,000
- B. \$180,000
- C. \$280,000
- D. \$540,000

Answer: A

Explanation:

The annualized loss expectancy will be \$360,000. Annualized loss expectancy (ALE) is the annually expected financial loss to an organization from a threat. The annualized loss expectancy (ALE) is the product of the annual rate of occurrence (ARO) and the single loss expectancy (SLE). It is mathematically expressed as follows:

ALE = Single Loss Expectancy (SLE) * Annualized Rate of Occurrence (ARO) Here, it is as follows:

SLE = Asset value * EF (Exposure factor)

= 600,000 * (30/100)

= 600,000 * 0.30

= 180,000

ALE = SLE * ARO

= 180,000 * 2

= 360,000

Answer C, B, and D are incorrect. These are not valid answers.

NEW QUESTION 25

The service-oriented modeling framework (SOMF) provides a common modeling notation to address alignment between business and IT organizations. Which of the following principles does the SOMF concentrate on? Each correct answer represents a part of the solution. Choose all that apply.

- A. Architectural components abstraction
- B. SOA value proposition

- C. Business traceability
- D. Disaster recovery planning
- E. Software assets reuse

Answer: ABCE

Explanation:

The service-oriented modeling framework (SOMF) concentrates on the following principles: Business traceability Architectural best-practices traceability Technological traceability SOA value proposition Software assets reuse SOA integration strategies Technological abstraction and generalization Architectural components abstraction Answer D is incorrect. The service-oriented modeling framework (SOMF) does not concentrate on it.

NEW QUESTION 27

You work as a project manager for a company. The company has started a new security software project. The software configuration management will be used throughout the lifecycle of the project. You are tasked to modify the functional features and the basic logic of the software and then make them compatible to the initial design of the project. Which of the following procedures of the configuration management will you follow to accomplish the task?

- A. Configuration status accounting
- B. Configuration control
- C. Configuration audits
- D. Configuration identification

Answer: B

Explanation:

Configuration control is a procedure of the Configuration management. Configuration control is a set of processes and approval stages required to change a configuration item's attributes and to re-baseline them. It supports the change of the functional and physical attributes of software at various points in time, and performs systematic control of changes to the identified attributes. Answer C is incorrect. Configuration audits confirm that the configuration identification for a configured item is accurate, complete, and will meet specified program needs. Configuration audits are broken into functional and physical configuration audits. They occur either at delivery or at the moment of effecting the change. A functional configuration audit ensures that functional and performance attributes of a configuration item are achieved, while a physical configuration audit ensures that a configuration item is installed in accordance with the requirements of its detailed design documentation. Answer D is incorrect. Configuration identification is the process of identifying the attributes that define every aspect of a configuration item. A configuration item is a product (hardware and/or software) that has an end-user purpose. These attributes are recorded in configuration documentation and baselined. Baselining an attribute forces formal configuration change control processes to be effected in the event that these attributes are changed. Answer A is incorrect. The configuration status accounting procedure is the ability to record and report on the configuration baselines associated with each configuration item at any moment of time. It supports the functional and physical attributes of software at various points in time, and performs systematic control of accounting to the identified attributes for the purpose of maintaining software integrity and traceability throughout the software development life cycle.

NEW QUESTION 31

Which of the following is designed to detect unwanted attempts at accessing, manipulating, and disabling of computer systems through the Internet?

- A. DAS
- B. IPsec
- C. IDS
- D. ACL

Answer: C

Explanation:

An Intrusion detection system (IDS) is software and/or hardware designed to detect unwanted attempts at accessing, manipulating, and/or disabling of computer systems, mainly through a network, such as the Internet. These attempts may take the form of attacks, as examples, by crackers, malware and/or disgruntled employees. An IDS cannot directly detect attacks within properly encrypted traffic. An intrusion detection system is used to detect several types of malicious behaviors that can compromise the security and trust of a computer system. This includes network attacks against vulnerable services, data driven attacks on applications, host based attacks such as privilege escalation, unauthorized logins and access to sensitive files, and malware (viruses, trojan horses, and worms). Answer D is incorrect. Access Control List (ACL) is the most commonly used object in Cisco IOS. It filters packets or network traffic by controlling whether routed packets are forwarded or blocked at the router's interfaces. According to the criteria specified within the access lists, router determines whether the packets to be forwarded or dropped. Access control list criteria could be the source or destination address of the traffic or other information. The types of Cisco ACLs are Standard IP, Extended IP, IPX, Appletalk, etc. Answer B is incorrect. Internet Protocol Security (IPSec) is a method of securing data. It secures traffic by using encryption and digital signing. It enhances the security of data as if an IPSec packet is captured, its contents cannot be read. IPSec also provides sender verification that ensures the certainty of the datagram's origin to the receiver. Answer A is incorrect. Direct-attached storage (DAS) is a digital storage system that is directly attached to a server or workstation, without using a storage network.

NEW QUESTION 32

Which of the following life cycle modeling activities establishes service relationships and message exchange paths?

- A. Service-oriented logical design modeling
- B. Service-oriented conceptual architecture modeling
- C. Service-oriented discovery and analysis modeling
- D. Service-oriented business integration modeling

Answer: A

Explanation:

The service-oriented logical design modeling establishes service relationships and message exchange paths. It also addresses service visibility and crafts service logical compositions.

NEW QUESTION 37

Which of the following methods does the Java Servlet Specification v2.4 define in the HttpServletRequest interface that control programmatic security? Each correct answer represents a complete solution. Choose all that apply.

- A. getCallerIdentity()
- B. isUserInRole()
- C. getUserPrincipal()
- D. getRemoteUser()

Answer: BCD

Explanation:

The various methods of the HttpServletRequest interface are as follows: getRemoteUser(): It returns the user name that is used for the client authentication. The value of the getRemoteUser() method returns null if no user is authenticated. isUserInRole(): It determines whether the remote user is granted a specified user role. The value of the isUserInRole() method returns true if the remote user is granted the specified user role; otherwise it returns false. getUserPrincipal(): It determines the principle name of the current user and returns the java.security.Principal object. The java.security.Principal object contains the remote user name. The value of the getUserPrincipal() method returns null if no user is authenticated. Answer A is incorrect. It is not defined in the HttpServletRequest interface. The getCallerIdentity() method is used to obtain the java.security.Identity of the caller.

NEW QUESTION 41

Which of the following DoD directives is referred to as the Defense Automation Resources Management Manual?

- A. DoD 8910.1
- B. DoD 7950.1-M
- C. DoDD 8000.1
- D. DoD 5200.22-M
- E. DoD 5200.1-R

Answer: B

Explanation:

The various DoD directives are as follows:

DoD 5200.1-R: This DoD directive refers to the 'Information Security Program Regulation'. DoD 5200.22-M: This DoD directive refers the 'National Industrial Security Program Operating Manual'. DoD 7950.1-M: This DoD directive refers to the 'Defense Automation Resources Management Manual'. DoDD 8000.1: This DoD directive refers to the 'Defense Information Management (IM) Program'. DoD 8910.1: This DoD directive refers to the 'Management and Control of Information Requirements'.

NEW QUESTION 44

FIPS 199 defines the three levels of potential impact on organizations. Which of the following potential impact levels shows limited adverse effects on organizational operations, organizational assets, or individuals?

- A. Moderate
- B. Low
- C. Medium
- D. High

Answer: B

Explanation:

The potential impact is called low if the loss of confidentiality, integrity, or availability is expected to have a limited adverse effect on organizational operations, organizational assets, or individuals. Answer C is incorrect. Such a type of potential impact level does not exist Answer A is incorrect. The potential impact is known to be moderate if the loss of confidentiality, integrity, or availability is expected to have a serious adverse effect on organizational operations, organizational assets, or individuals. Answer D is incorrect. The potential impact is called high if the loss of confidentiality, integrity, or availability is expected to have a severe or catastrophic adverse effect on organizational operations, organizational assets, or individuals.

NEW QUESTION 47

Which of the following is the duration of time and a service level within which a business process must be restored after a disaster in order to avoid unacceptable consequences associated with a break in business continuity?

- A. RTO
- B. RTA
- C. RPO
- D. RCO

Answer: A

Explanation:

The Recovery Time Objective (RTO) is the duration of time and a service level within which a business process must be restored after a disaster or disruption in order to avoid unacceptable consequences associated with a break in business continuity. It includes the time for trying to fix the problem without a recovery, the recovery itself, tests and the communication to the users. Decision time for user representative is not included. The business continuity timeline usually runs parallel with an incident management timeline and may start at the same, or different, points. In accepted business continuity planning methodology, the RTO is established during the Business Impact Analysis (BIA) by the owner of a process (usually in conjunction with the Business Continuity planner). The RTOs are then presented to senior management for acceptance. The RTO attaches to the business process and not the resources required to support the process. Answer B is incorrect. The Recovery Time Actual (RTA) is established during an exercise, actual event, or predetermined based on recovery methodology the technology support team develops. This is the time frame the technology support takes to deliver the recovered infrastructure to the business. Answer D is incorrect. The Recovery Consistency Objective (RCO) is used in Business Continuity Planning in addition to Recovery Point Objective (RPO) and Recovery Time Objective (RTO). It applies data consistency objectives to Continuous Data Protection services. Answer C is incorrect. The Recovery Point Objective (RPO) describes the acceptable amount of data loss measured in time. It is the point in time to which data must be recovered as defined by the organization. The RPO is generally a definition of what an organization determines is an "acceptable loss" in a disaster situation. If the RPO of a company is 2 hours and the time it takes to get the data back into production is 5 hours, the RPO is still 2 hours. Based on this RPO the data must be restored to within 2 hours of the disaster.

NEW QUESTION 48

Which of the following processes culminates in an agreement between key players that a system in its current configuration and operation provides adequate protection controls?

- A. Information Assurance (IA)
- B. Information systems security engineering (ISSE)
- C. Certification and accreditation (C&A)
- D. Risk Management

Answer: C

Explanation:

Certification and accreditation (C&A) is a set of processes that culminate in an agreement between key players that a system in its current configuration and operation provides adequate protection controls. Certification and Accreditation (C&A or CnA) is a process for implementing information security. It is a systematic procedure for evaluating, describing, testing, and authorizing systems prior to or after a system is in operation. The C&A process is used extensively in the U.S. Federal Government. Some C&A processes include FISMA, NIACAP, DIACAP, and DCID 6/3. Certification is a comprehensive assessment of the management, operational, and technical security controls in an information system, made in support of security accreditation, to determine the extent to which the controls are implemented correctly, operating as intended, and producing the desired outcome with respect to meeting the security requirements for the system. Accreditation is the official management decision given by a senior agency official to authorize operation of an information system and to explicitly accept the risk to agency operations (including mission, functions, image, or reputation), agency assets, or individuals, based on the implementation of an agreed-upon set of security controls. Answer D is incorrect. Risk management is a set of processes that ensures a risk-based approach is used to determine adequate, cost-effective security for a system. Answer A is incorrect. Information assurance (IA) is the process of organizing and monitoring information-related risks. It ensures that only the approved users have access to the approved information at the approved time. IA practitioners seek to protect and defend information and information systems by ensuring confidentiality, integrity, authentication, availability, and non-repudiation. These objectives are applicable whether the information is in storage, processing, or transit, and whether threatened by an attack. Answer B is incorrect. ISSE is a set of processes and solutions used during all phases of a system's life cycle to meet the system's information protection needs.

NEW QUESTION 52

Which of the following areas of information system, as separated by Information Assurance Framework, is a collection of local computing devices, regardless of physical location, that are interconnected via local area networks (LANs) and governed by a single security policy?

- A. Local Computing Environments
- B. Networks and Infrastructures
- C. Supporting Infrastructures
- D. Enclave Boundaries

Answer: D

Explanation:

The areas of information system, as separated by Information Assurance Framework, are as follows: Local Computing Environments: This area includes servers, client workstations, operating system, and applications. Enclave Boundaries: This area consists of collection of local computing devices, regardless of physical location, that are interconnected via local area networks (LANs) and governed by a single security policy. Networks and Infrastructures: This area provides the network connectivity between enclaves. It includes operational area networks (OANs), metropolitan area networks (MANs), and campus area networks (CANs). Supporting Infrastructures: This area provides security services for networks, client workstations, Web servers, operating systems, applications, files, and single-use infrastructure machines

NEW QUESTION 54

Which of the following ensures that a party to a dispute cannot deny the authenticity of their signature on a document or the sending of a message that they originated?

- A. Confidentiality
- B. OS fingerprinting
- C. Reconnaissance
- D. Non-repudiation

Answer: D

Explanation:

Non-repudiation is a term that refers to the ability to ensure that a party to a dispute cannot deny the authenticity of their signature on a document or the sending of a message that they originated. Non-repudiation is the concept of ensuring that a party in a dispute cannot refuse to acknowledge, or refute the validity of a statement or contract. As a service, it provides proof of the integrity and origin of data. Although this concept can be applied to any transmission, including television and radio, by far the most common application is in the verification and trust of signatures. Answer A is incorrect. Confidentiality is a mechanism that ensures that only the intended and authorized recipients are able to read data. The data is so encrypted that even if an unauthorized user gets access to it, he will not get any meaning out of it. Answer C is incorrect. Reconnaissance is a term that refers to information gathering behaviors that aim to profile the organization, employees, network, and systems before an attack is performed efficiently. It is the first step in the process of intrusion and involves unauthorized discovery and mapping of systems, services, or vulnerabilities. These discovery and mapping techniques are commonly known as scanning and enumeration. Common tools, commands, and utilities used for scanning and enumeration include ping, telnet, nslookup, rpcinfo, File Explorer, finger, etc. Reconnaissance activities take place before performing a malicious attack. These activities are used to increase the probability of successful operation against the target, and to increase the probability of hiding the attacker's identity. Answer B is incorrect. OS fingerprinting is a process in which an external host sends special traffic on the external network interface of a computer to determine the computer's operating system. It is one of the primary steps taken by hackers in preparing an attack.

NEW QUESTION 56

You are the project manager of the NNN project for your company. You and the project team are working together to plan the risk responses for the project. You feel that the team has successfully completed the risk response planning and now you must initiate what risk process it is. Which of the following risk processes is repeated after the plan risk responses to determine if the overall project risk has been satisfactorily decreased?

- A. Quantitative risk analysis
- B. Risk identification
- C. Risk response implementation
- D. Qualitative risk analysis

Answer: A

Explanation:

The quantitative risk analysis process is repeated after the plan risk responses to determine if the overall project risk has been satisfactorily decreased. Answer D is incorrect. Qualitative risk analysis is not repeated after the plan risk response process. Answer B is incorrect. Risk identification is an ongoing process that happens throughout the project. Answer C is incorrect. Risk response implementation is not a project management process.

NEW QUESTION 59

The IAM/CA makes certification accreditation recommendations to the DAA. The DAA issues accreditation determinations. Which of the following are the accreditation determinations issued by the DAA? Each correct answer represents a complete solution. Choose all that apply.

- A. IATT
- B. IATO
- C. DATO
- D. ATO
- E. ATT

Answer: ABCD

Explanation:

The DAA issues one of the following four accreditation determinations: Approval to Operate (ATO): It is an authorization of a DoD information system to process, store, or transmit information. Interim Approval to Operate (IATO): It is a temporary approval to operate based on an assessment of the implementation status of the assigned IA Controls. Interim Approval to Test (IATT): It is a temporary approval to conduct system testing based on an assessment of the implementation status of the assigned IA Controls. Denial of Approval to Operate (DATO): It is a determination that a DoD information system cannot operate because of an inadequate IA design or failure to implement assigned IA Controls. Answer E is incorrect. No such type of accreditation determination exists.

NEW QUESTION 61

The Information System Security Officer (ISSO) and Information System Security Engineer (ISSE) play the role of a supporter and advisor, respectively. Which of the following statements are true about ISSO and ISSE? Each correct answer represents a complete solution. Choose all that apply.

- A. An ISSE manages the security of the information system that is slated for Certification & Accreditation (C&A).
- B. An ISSE provides advice on the continuous monitoring of the information system.
- C. An ISSO manages the security of the information system that is slated for Certification & Accreditation (C&A).
- D. An ISSE provides advice on the impacts of system change
- E. An ISSO takes part in the development activities that are required to implement system changes.

Answer: BCD

Explanation:

An Information System Security Officer (ISSO) plays the role of a supporter. The responsibilities of an Information System Security Officer (ISSO) are as follows: Manages the security of the information system that is slated for Certification & Accreditation (C&A). Insures the information systems configuration with the agency's information security policy. Supports the information system owner/information owner for the completion of security-related responsibilities. Takes part in the formal configuration management process. Prepares Certification & Accreditation (C&A) packages. An Information System Security Engineer (ISSE) plays the role of an advisor. The responsibilities of an Information System Security Engineer are as follows: Provides view on the continuous monitoring of the information system. Provides advice on the impacts of system changes. Takes part in the configuration management process. Takes part in the development activities that are required to implement system changes. Follows approved system changes.

NEW QUESTION 63

Which of the following are examples of the application programming interface (API)? Each correct answer represents a complete solution. Choose three.

- A. HTML
- B. PHP
- C. .NET
- D. Perl

Answer: BCD

Explanation:

Perl, .NET, and PHP are examples of the application programming interface (API). API is a set of routines, protocols, and tools that users can use to work with a component, application, or operating system. It consists of one or more DLLs that provide specific functionality. API helps in reducing the development time of applications by reducing application code. Most operating environments, such as MS-Windows, provide an API so that programmers can write applications consistent with the operating environment. Answer A is incorrect. HTML stands for Hypertext Markup Language. It is a set of markup symbols or codes used to create Web pages and define formatting specifications. The markup tells the Web browser how to display the content of the Web page.

NEW QUESTION 66

Which of the following types of signatures is used in an Intrusion Detection System to trigger on attacks that attempt to reduce the level of a resource or system, or to cause it to crash?

- A. Access
- B. Benign
- C. DoS
- D. Reconnaissance

Answer: C

Explanation:

Following are the basic categories of signatures: Informational (benign): These types of signatures trigger on normal network activity. For example: ICMP echo

requests The opening or closing of TCP or UDP connections Reconnaissance: These types of signatures trigger on attacks that uncover resources and hosts that are reachable, as well as any possible vulnerabilities that they might contain. For example: Reconnaissance attacks include ping sweeps DNS queries Port scanning Access: These types of signatures trigger on access attacks, which include unauthorized access, unauthorized escalation of privileges, and access to protected or sensitive data. For example:

Back Orifice A Unicode attack against the Microsoft IIS NetBus DoS: These types of signatures trigger on attacks that attempt to reduce the level of a resource or system, or to cause it to crash. For example: TCP SYN floods The Ping of Death Smurf Fraggles Trinoo Tribe Flood Network

NEW QUESTION 69

Bill is the project manager of the JKH Project. He and the project team have identified a risk event in the project with a high probability of occurrence and the risk event has a high cost impact on the project. Bill discusses the risk event with Virginia, the primary project customer, and she decides that the requirements surrounding the risk event should be removed from the project. The removal of the requirements does affect the project scope, but it can release the project from the high risk exposure. What risk response has been enacted in this project?

- A. Mitigation
- B. Transference
- C. Acceptance
- D. Avoidance

Answer: D

Explanation:

This is an example of the avoidance risk response. Because the project plan has been changed to avoid the risk event, so it is considered the avoidance risk response. Risk avoidance is a technique used for threats. It creates changes to the project management plan that are meant to either eliminate the risk completely or to protect the project objectives from its impact. Risk avoidance removes the risk event entirely either by adding additional steps to avoid the event or reducing the project scope requirements. It may seem the answer to all possible risks, but avoiding risks also means losing out on the potential gains that accepting (retaining) the risk might have allowed. Answer C is incorrect. Acceptance is when the stakeholders acknowledge the risk event and they accept that the event could happen and could have an impact on the project. Acceptance is usually used for risk events that have low risk exposure or risk events in which the project has no control, such as a pending law or weather threats. Answer A is incorrect. Mitigation is involved with the actions to reduce an included risk's probability and/or impact on the project's objectives. As the risk was removed from the project, this scenario describes avoidance, not mitigation. Answer B is incorrect. Transference is when the risk is still within the project, but the ownership and management of the risk event is transferred to a third party - usually for a fee.

NEW QUESTION 74

Which of the following process areas does the SSE-CMM define in the 'Project and Organizational Practices' category? Each correct answer represents a complete solution. Choose all that apply.

- A. Provide Ongoing Skills and Knowledge
- B. Verify and Validate Security
- C. Manage Project Risk
- D. Improve Organization's System Engineering Process

Answer: ACD

Explanation:

Project and Organizational Practices include the following process areas: PA12: Ensure Quality PA13: Manage Configuration PA14: Manage Project Risk PA15: Monitor and Control Technical Effort PA16: Plan Technical Effort PA17: Define Organization's System Engineering Process PA18: Improve Organization's System Engineering Process PA19: Manage Product Line Evolution PA20: Manage Systems Engineering Support Environment PA21: Provide Ongoing Skills and Knowledge PA22: Coordinate with Suppliers

NEW QUESTION 78

You work as the senior project manager in SoftTech Inc. You are working on a software project using configuration management. Through configuration management you are decomposing the verification system into identifiable, understandable, manageable, traceable units that are known as Configuration Items (CIs). According to you, which of the following processes is known as the decomposition process of a verification system into Configuration Items?

- A. Configuration status accounting
- B. Configuration identification
- C. Configuration auditing
- D. Configuration control

Answer: B

Explanation:

Configuration identification is known as the decomposition process of a verification system into Configuration Items. Configuration identification is the process of identifying the attributes that define every aspect of a configuration item. A configuration item is a product (hardware and/or software) that has an end-user purpose. These attributes are recorded in configuration documentation and baselined. Baselining an attribute forces formal configuration change control processes to be effected in the event that these attributes are changed. Answer D is incorrect. Configuration control is a procedure of the Configuration management. Configuration control is a set of processes and approval stages required to change a configuration item's attributes and to re-baseline them. It supports the change of the functional and physical attributes of software at various points in time, and performs systematic control of changes to the identified attributes. Configuration control is a means of ensuring that system changes are approved before being implemented. Only the proposed and approved changes are implemented, and the implementation is complete and accurate. Answer A is incorrect. The configuration status accounting procedure is the ability to record and report on the configuration baselines associated with each configuration item at any moment of time. It supports the functional and physical attributes of software at various points in time, and performs systematic control of accounting to the identified attributes for the purpose of maintaining software integrity and traceability throughout the software development life cycle. Answer C is incorrect. Configuration auditing is the quality assurance element of configuration management. It is occupied in the process of periodic checks to establish the consistency and completeness of accounting information and to validate that all configuration management policies are being followed. Configuration audits are broken into functional and physical configuration audits. They occur either at delivery or at the moment of effecting the change. A functional configuration audit ensures that functional and performance attributes of a configuration item are achieved, while a physical configuration audit ensures that a configuration item is installed in accordance with the requirements of its detailed design documentation.

NEW QUESTION 83

Which of the following models uses a directed graph to specify the rights that a subject can transfer to an object or that a subject can take from another subject?

- A. Take-Grant Protection Model
- B. Biba Integrity Model
- C. Bell-LaPadula Model
- D. Access Matrix

Answer: A

Explanation:

The take-grant protection model is a formal model used in the field of computer security to establish or disprove the safety of a given computer system that follows specific rules. It shows that for specific systems the question of safety is decidable in linear time, which is in general undecidable. The model represents a system as directed graph, where vertices are either subjects or objects. The edges between them are labeled and the label indicates the rights that the source of the edge has over the destination. Two rights occur in every instance of the model: take and grant. They play a special role in the graph rewriting rules describing admissible changes of the graph. Answer D is incorrect. The access matrix is a straightforward approach that provides access rights to subjects for objects. Answer C is incorrect. The Bell-LaPadula model deals only with the confidentiality of classified material. It does not address integrity or availability. Answer B is incorrect. The integrity model was developed as an analog to the Bell-LaPadula confidentiality model and then became more sophisticated to address additional integrity requirements.

NEW QUESTION 87

Della work as a project manager for BlueWell Inc. A threat with a dollar value of \$250,000 is expected to happen in her project and the frequency of threat occurrence per year is 0.01. What will be the annualized loss expectancy in her project?

- A. \$2,000
- B. \$2,500
- C. \$3,510
- D. \$3,500

Answer: B

Explanation:

The annualized loss expectancy in her project will be \$2,500. Annualized loss expectancy (ALE) is the annually expected financial loss to an organization from a threat. The annualized loss expectancy (ALE) is the product of the annual rate of occurrence (ARO) and the single loss expectancy (SLE). It is mathematically expressed as follows: $ALE = \text{Single Loss Expectancy (SLE)} * \text{Annualized Rate of Occurrence (ARO)}$ Here, it is as follows:

$$\begin{aligned} ALE &= SLE * ARO \\ &= 250,000 * 0.01 \\ &= 2,500 \end{aligned}$$

Answer D, C, and A are incorrect. These are not valid answers.

NEW QUESTION 89

There are seven risks responses that a project manager can choose from. Which risk response is appropriate for both positive and negative risk events?

- A. Acceptance
- B. Transference
- C. Sharing
- D. Mitigation

Answer: A

Explanation:

Only acceptance is appropriate for both positive and negative risk events. Often sharing is used for low probability and low impact risk events regardless of the positive or negative effects the risk event may bring the project. Acceptance response is a part of Risk Response planning process. Acceptance response delineates that the project plan will not be changed to deal with the risk. Management may develop a contingency plan if the risk does occur. Acceptance response to a risk event is a strategy that can be used for risks that pose either threats or opportunities. Acceptance response can be of two types: Passive acceptance: It is a strategy in which no plans are made to try or avoid or mitigate the risk. Active acceptance: Such responses include developing contingency reserves to deal with risks, in case they occur. Acceptance is the only response for both threats and opportunities. Answer C is incorrect. Sharing is a positive risk response that shares an opportunity for all parties involved in the risk event. Answer B is incorrect. Transference is a negative risk event that transfers the risk ownership to a third party, such as vendor, through a contractual relationship. Answer D is incorrect. Mitigation is a negative risk event that seeks to lower the probability and/or impact of a risk event.

NEW QUESTION 91

Which of the following tools is used to attack the Digital Watermarking?

- A. Steg-Only Attack
- B. Active Attacks
- C. 2Mosaic
- D. Gifshuffle

Answer: C

Explanation:

2Mosaic is a tool used for watermark breaking. It is an attack against a digital watermarking system. In this type of attack, an image is chopped into small pieces and then placed together. When this image is embedded into a web page, the web browser renders the small pieces into one image. This image looks like a real image with no watermark in it. This attack is successful, as it is impossible to read watermark in very small pieces. Answer D is incorrect. Gifshuffle is used to hide message or information inside GIF images. It is done by shuffling the colormap. This tool also provides compression and encryption. Answer B and A are incorrect. Active Attacks and Steg-Only Attacks are used to attack Steganography.

NEW QUESTION 95

CORRECT TEXT

Fill in the blank with an appropriate phrase. models address specifications, requirements, design, verification and validation, and maintenance activities.

A. Life cycle

Answer: A

Explanation:

A life cycle model helps to provide an insight into the development process and emphasizes on the relationships among the different activities in this process. This model describes a structured approach to the development and adjustment process involved in producing and maintaining systems. The life cycle model addresses specifications, design, requirements, verification and validation, and maintenance activities.

NEW QUESTION 98

You work as a security engineer for BlueWell Inc. Which of the following documents will you use as a guide for the security certification and accreditation of Federal Information Systems?

- A. NIST Special Publication 800-60
- B. NIST Special Publication 800-53
- C. NIST Special Publication 800-37
- D. NIST Special Publication 800-59

Answer: C

Explanation:

NIST has developed a suite of documents for conducting Certification & Accreditation (C&A). These documents are as follows: NIST Special Publication 800-37: This document is a guide for the security certification and accreditation of Federal Information Systems.

NIST Special Publication 800-53: This document provides a guideline for security controls for Federal Information Systems. NIST Special Publication 800-53A.

This document consists of techniques and procedures for verifying the effectiveness of security controls in Federal Information System. NIST Special Publication

800-59: This document is a guideline for identifying an information system as a National Security System. NIST Special Publication 800-60: This document is a guide for mapping types of information and information systems to security objectives and risk levels.

NEW QUESTION 100

Which of the following actions does the Data Loss Prevention (DLP) technology take when an agent detects a policy violation for data of all states? Each correct answer represents a complete solution. Choose all that apply.

- A. It creates an alert.
- B. It quarantines the file to a secure location.
- C. It reconstructs the session.
- D. It blocks the transmission of content.

Answer: ABD

Explanation:

When an agent detects a policy violation for data of all states, the Data Loss prevention (DLP) technology takes one of the following actions: It creates an alert. It notifies an administrator of a violation. It quarantines the file to a secure location. It encrypts the file. It blocks the transmission of content. Answer C is incorrect.

Data Loss Prevention (DLP) reconstructs the session when data is in motion.

NEW QUESTION 104

Which of the following rated systems of the Orange book has mandatory protection of the TCB?

- A. A-rated
- B. B-rated
- C. D-rated
- D. C-rated

Answer: B

Explanation:

A B-rated system of the orange book has mandatory protection of the trusted computing base (TCB).

Trusted computing base (TCB) refers to hardware, software, controls, and processes that cause a computer system or network to be devoid of malicious software or hardware. Maintaining the trusted computing base (TCB) is essential for security policy to be implemented successfully.

NEW QUESTION 107

You are the project manager for GHY Project and are working to create a risk response for a negative risk. You and the project team have identified the risk that the project may not complete on time, as required by the management, due to the creation of the user guide for the software you're creating. You have elected to hire an external writer in order to satisfy the requirements and to alleviate the risk event. What type of risk response have you elected to use in this instance?

- A. Transference
- B. Exploiting
- C. Avoidance
- D. Sharing

Answer: A

Explanation:

This is an example of transference as you have transferred the risk to a third party. Transference almost always is done with a negative risk event and it usually requires a contractual relationship.

NEW QUESTION 108

Which of the following statements best describes the difference between the role of a data owner and the role of a data custodian?

- A. The custodian makes the initial information classification assignments, and the operations manager implements the scheme.
- B. The data owner implements the information classification scheme after the initial assignment by the custodian.
- C. The custodian implements the information classification scheme after the initial assignment by the operations manager.
- D. The data custodian implements the information classification scheme after the initial assignment by the data owner.

Answer: D

Explanation:

The data owner is responsible for ensuring that the appropriate security controls are in place, for assigning the initial classification to the data to be protected, for approving access requests from other parts of the organization, and for periodically reviewing the data classifications and access rights. Data owners are primarily responsible for determining the data's sensitivity or classification levels, whereas the data custodian has the responsibility for backup, retention, and recovery of data. The data owner delegates these responsibilities to the custodian. Answer B, A, and C are incorrect. These are not the valid answers.

NEW QUESTION 113

DRAG DROP Drag and drop the appropriate principle documents in front of their respective functions.

Principle document	Function	
Drop Here	It establishes a national risk management policy for national security systems.	CNSSP 22
Drop Here	It combines DCID 6/3, DOD Instructions 8500.2, NIST SP 800-53, and other security sources.	CNSSI 1253
Drop Here	It offers the techniques to assess adequacy of each security control.	CNSSI 1253A
Drop Here	It provides guidance to organizations with the characterization of their information and information systems.	CNSSI 1260

- A. Mastered
- B. Not Mastered

Answer: A

Explanation:

The various principle documents of transformation are as follows: CNSSP 22: It establishes a national risk management policy for national security systems. CNSSI 1199: It creates the technique in which the national security community classifies the information and information systems with regard to confidentiality, integrity, and availability. CNSSI 1253: It combines DCID 6/3, DOD Instructions 8500.2, NIST SP 800-53, and other security sources into a single cohesive repository of security controls. CNSSI 1253 A. It offers the techniques to assess adequacy of each security control. CNSSI 1260: It provides guidance to organizations with the characterization of their information and information systems. NIST 800-37, Revision 1: It defines the certification and accreditation (C & A) process. The NIST 800-37, Revision 1 is a combination of DNI, DoD, and NIST.

NEW QUESTION 116

Penetration testing (also called pen testing) is the practice of testing a computer system, network, or Web application to find vulnerabilities that an attacker could exploit. Which of the following areas can be exploited in a penetration test? Each correct answer represents a complete solution. Choose all that apply.

- A. Kernel flaws
- B. Information system architectures
- C. Race conditions
- D. File and directory permissions
- E. Buffer overflows
- F. Trojan horses
- G. Social engineering

Answer: ACDEFG

Explanation:

Penetration testing (also called pen testing) is the practice of testing a computer system, network, or Web application to find vulnerabilities that an attacker could exploit. Following are the areas that can be exploited in a penetration test: Kernel flaws: Kernel flaws refer to the exploitation of kernel code flaws in the operating system. Buffer overflows: Buffer overflows refer to the exploitation of a software failure to properly check for the length of input data. This overflow can cause malicious behavior on the system. Race conditions: A race condition is a situation in which an attacker can gain access to a system as a privileged user. File and directory permissions: In this area, an attacker exploits weak permissions restrictions to gain unauthorized access of documents. Trojan horses: These are malicious programs that can exploit an information system by attaching themselves in valid programs and files. Social engineering: In this technique, an attacker uses his social skills and persuasion to acquire valuable information that can be used to conduct an attack against a system.

NEW QUESTION 118

Which of the following types of activities can be audited for security? Each correct answer represents a complete solution. Choose three.

- A. File and object access
- B. Data downloading from the Internet
- C. Printer access
- D. Network logons and logoffs

Answer: ACD

Explanation:

The following types of activities can be audited: Network logons and logoffs File access Printer access Remote access service Application usage Network services Auditing is used to track user accounts for file and object access, logon attempts, system shutdown, etc. This enhances the security of the network. Before enabling security auditing, the type of event to be audited should be specified in the audit policy. Auditing is an essential component to maintain the security of deployed systems. Security auditing depends on the criticality of the environment and on the company's security policy. The security system should be reviewed periodically. Answer B is incorrect. Data downloading from the Internet cannot be audited.

NEW QUESTION 121

The Project Risk Management knowledge area focuses on which of the following processes? Each correct answer represents a complete solution. Choose all that apply.

- A. Risk Monitoring and Control
- B. Risk Management Planning
- C. Quantitative Risk Analysis
- D. Potential Risk Monitoring

Answer: ABC

Explanation:

The Project Risk Management knowledge area focuses on the following processes: Risk Management Planning Risk Identification Qualitative Risk Analysis Quantitative Risk Analysis Risk Response Planning Risk Monitoring and Control Answer D is incorrect. There is no such process in the Project Risk Management knowledge area.

NEW QUESTION 122

The DoD 8500 policy series represents the Department's information assurance strategy. Which of the following objectives are defined by the DoD 8500 series? Each correct answer represents a complete solution. Choose all that apply.

- A. Defending systems
- B. Providing IA Certification and Accreditation
- C. Providing command and control and situational awareness
- D. Protecting information

Answer: ACD

Explanation:

The various objectives of the DoD 8500 series are as follows: Protecting information Defending systems Providing command and control and situational awareness Making sure that the information assurance is integrated into processes Increasing security awareness throughout the DoD's workforce

NEW QUESTION 123

Which of the following security controls works as the totality of protection mechanisms within a computer system, including hardware, firmware, and software, the combination of which is responsible for enforcing a security policy?

- A. Common data security architecture (CDSA)
- B. Application program interface (API)
- C. Trusted computing base (TCB)
- D. Internet Protocol Security (IPSec)

Answer: C

Explanation:

Trusted computing base (TCB) refers to hardware, software, controls, and processes that cause a computer system or network to be devoid of malicious software or hardware. Maintaining the trusted computing base (TCB) is essential for security policy to be implemented successfully. Answer D is incorrect. Internet Protocol Security (IPSec) is a standard-based protocol that provides the highest level of VPN security. IPSec can encrypt virtually everything above the networking layer. It is used for VPN connections that use the L2TP protocol. It secures both data and password. IPSec cannot be used with Point-to- Point Tunneling Protocol (PPTP). Answer A is incorrect. The Common data security architecture (CDSA) is a set of layered security services and cryptographic framework. It deals with the communications and data security problems in the emerging Internet and intranet application space. It presents an infrastructure for building cross-platform, interoperable, security-enabled applications for client-server environments. Answer B is incorrect. An application programming interface (API) is an interface implemented by a software program which enables it to interact with other software. It facilitates interaction between different software programs similar to the way the user interface facilitates interaction between humans and computers. An API is implemented by applications, libraries, and operating systems to determine their vocabularies and calling conventions, and is used to access their services. It may include specifications for routines, data structures, object classes, and protocols used to communicate between the consumer and the implementer of the API.

NEW QUESTION 127

DRAG DROP Drag and drop the appropriate external constructs in front of their respective functions.

External construct	Function	
Drop Here	One system gains the input from the output of another system.	Cascading
Drop Here	One system provides the input to another system, which in turn feeds back to the input of the first system.	Feedback
Drop Here	One system communicates with another system as well as with external entities.	Hookup

- A. Mastered
- B. Not Mastered

Answer: A

Explanation:

There are two types of compositional constructs: 1.External constructs: The various types of external constructs are as follows: Cascading: In this type of external construct, one system gains the input from the output of another system. Feedback: In this type of external construct, one system provides the input to another system, which in turn feeds back to the input of the first system. Hookup: In this type of external construct, one system communicates with another system as well as with external entities. 2.Internal constructs: The internal constructs include intersection, union, and difference.

NEW QUESTION 131

Which of the following is a malicious exploit of a website, whereby unauthorized commands are transmitted from a user trusted by the website?

- A. Cross-Site Scripting
- B. Injection flaw
- C. Side channel attack
- D. Cross-Site Request Forgery

Answer: D

Explanation:

CSRF (Cross-Site Request Forgery) is a malicious exploit of a website, whereby unauthorized commands are transmitted from a user trusted by the website. It is also known as a one-click attack or session riding. CSRF occurs when a user is tricked by an attacker into activating a request in order to perform some unauthorized action. It increases data loss and malicious code execution. Answer A is incorrect. Cross-site scripting (XSS) is a type of computer security vulnerability typically found in web applications which enable malicious attackers to inject client-side script into web pages viewed by other users. An exploited cross-site scripting vulnerability can be used by attackers to bypass access controls, such as the same origin policy. Cross-site scripting carried out on websites were roughly 80% of all security vulnerabilities documented by Symantec as of 2007. Their impact may range from a petty nuisance to a significant security risk, depending on the sensitivity of the data handled by the vulnerable site, and the nature of any security mitigations implemented by the site owner. Answer C is incorrect. A side channel attack is based on information gained from the physical implementation of a cryptosystem, rather than brute force or theoretical weaknesses in the algorithms (compare cryptanalysis). For example, timing information, power consumption, electromagnetic leaks or even sound can provide an extra source of information which can be exploited to break the system. Many side- channel attacks require considerable technical knowledge of the internal operation of the system on which the cryptography is implemented. Answer B is incorrect. Injection flaws are the vulnerabilities where a foreign agent illegally uses a sub-system. They are the vulnerability holes that can be used to attack a database of Web applications. It is the most common technique of attacking a database. Injection occurs when user-supplied data is sent to an interpreter as part of a command or query. The attacker's hostile data tricks the interpreter into executing involuntary commands or changing data. Injection flaws include XSS (HTML Injection) and SQL Injection.

NEW QUESTION 135

Which of the following techniques is used to identify attacks originating from a botnet?

- A. Passive OS fingerprinting
- B. Recipient filtering
- C. IFilter
- D. BPF-based filter

Answer: A

Explanation:

Passive OS fingerprinting can identify attacks originating from a botnet. Network Administrators can configure the firewall to take action on a botnet attack by using information obtained from passive OS fingerprinting. Passive OS fingerprinting (POSFP) allows the sensor to determine the operating system used by the hosts. The sensor examines the traffic flow between two hosts and then stores the operating system of those two hosts along with their IP addresses. In order to determine the type of operating system, the sensor analyzes TCP SYN and SYN ACK packets that are traveled on the network. The sensor computes the attack relevance rating to determine the relevancy of victim attack using the target host OS. After it, the sensor modifies the alert's risk rating or filters the alert for the attack. Passive OS fingerprinting is also used to improve the alert output by reporting some information, such as victim OS, relevancy to the victim in the alert, and source of the OS identification. Answer D is incorrect. A BPF-based filter is used to limit the number of packets seen by tcpdump; this renders the output more usable on networks with a high volume of traffic. Answer B is incorrect. Recipient filtering is used to block messages on the basis of whom they are sent to. Answer C is incorrect. IFilters are used to extract contents from files that are crawled. IFilters also remove application-specific formatting before the content of a document is indexed by the search engine.

NEW QUESTION 136

Which of the following are included in Technical Controls? Each correct answer represents a complete solution. Choose all that apply.

- A. Identification and authentication methods
- B. Configuration of the infrastructure
- C. Password and resource management
- D. Implementing and maintaining access control mechanisms
- E. Security devices
- F. Conducting security-awareness training

Answer: ABCDE

Explanation:

Technical Controls are also known as Logical Controls. These controls include the following: Implementing and maintaining access control mechanisms Password and resource management Identification and authentication methods Security devices Configuration of the infrastructure Answer F is incorrect. It is a part of Administrative Controls.

NEW QUESTION 140

Fred is the project manager of the CPS project. He is working with his project team to prioritize the identified risks within the CPS project. He and the team are prioritizing risks for further analysis or action by assessing and combining the risks probability of occurrence and impact. What process is Fred completing?

- A. Risk identification
- B. Risk Breakdown Structure creation
- C. Perform qualitative analysis
- D. Perform quantitative analysis

Answer: C

Explanation:

Qualitative ranks the probability and impact and then helps the project manager and team to determine which risks need further analysis. Perform Qualitative Risk Analysis is the process of prioritizing risks for further analysis and action. It combines risks and their probability of occurrences and ranks them accordingly. It enables organizations to improve the project's performance by focusing on high-priority risks. Perform Qualitative Risk Analysis is usually a rapid and cost-effective means of establishing priorities for Plan Risk Responses. It also lays the foundation for Perform Quantitative Risk Analysis. Answer A is incorrect. Risk identification precedes this activity. Answer B is incorrect. This process does not describe the decomposition and organization of risks that you will complete in a risk breakdown structure. Answer D is incorrect. Quantitative analysis is the final step of risk analysis. Note the question tells you that Fred and the team will identify risks for additional analysis.

NEW QUESTION 145

What project management plan is most likely to direct the quantitative risk analysis process for a project in a matrix environment?

- A. Risk analysis plan
- B. Staffing management plan
- C. Risk management plan
- D. Human resource management plan

Answer: C

Explanation:

The risk management plan defines how risks will be identified, analyzed, responded to, and then monitored and controlled regardless of the structure of the organization. Answer D is incorrect. The human resources management plan does define how risks will be analyzed. Answer B is incorrect. The staffing management plan does define how risks will be analyzed. Answer A is incorrect. The risk analysis plan does define how risks will be analyzed.

NEW QUESTION 146

Stella works as a system engineer for BlueWell Inc. She wants to identify the performance thresholds of each build. Which of the following tests will help Stella to achieve her task?

- A. Reliability test
- B. Performance test
- C. Regression test
- D. Functional test

Answer: B

Explanation:

The various types of internal tests performed on builds are as follows: Regression tests: It is also known as the verification testing. These tests are developed to confirm that capabilities in earlier builds continue to work correctly in the subsequent builds. Functional test: These tests emphasizes on verifying that the build meets its functional and data requirements and correctly generates each expected display and report. Performance tests: These tests are used to identify the performance thresholds of each build. Reliability tests: These tests are used to identify the reliability thresholds of each build.

NEW QUESTION 149

Which of the following agencies is responsible for funding the development of many technologies such as computer networking, as well as NLS?

- A. DIAP
- B. DTIC
- C. DARPA
- D. DISA

Answer: C

Explanation:

The Defense Advanced Research Projects Agency (DARPA) is an agency of the United States Department of Defense responsible for the development of new technology for use by the military. DARPA has been responsible for funding the development of many technologies which have had a major effect on the world, including computer networking, as well as NLS, which was both the first hypertext system, and an important precursor to the contemporary ubiquitous graphical user interface. DARPA supplies technological options for the entire Department, and is designed to be the "technological engine" for transforming DoD. Answer D is incorrect. The Defense Information Systems Agency is a United States Department of Defense combat support agency with the goal of providing real-time information technology (IT) and communications support to the President, Vice President, Secretary of Defense, the military Services, and the Combatant Commands. DISA, a Combat Support Agency, engineers and provides command and control capabilities and enterprise infrastructure to continuously operate and assure a global net-centric enterprise in direct support to joint warfighters, National level leaders, and other mission and coalition partners across the full spectrum of operations.

Answer B is incorrect. The Defense Technical Information Center (DTIC) is a repository of scientific and technical documents for the United States Department of Defense. DTIC serves the DoD community as the largest central resource for DoD and government-funded scientific, technical, engineering, and business related information available today. DTIC's documents are available to DoD personnel and defense contractors, with unclassified documents also available to the public. DTIC's aim is to serve a vital link in the transfer of information among DoD personnel, DoD contractors, and potential contractors and other U.S. Government agency personnel and their contractors. Answer A is incorrect. The Defense-wide Information Assurance Program (DIAP) protects and supports DoD information, information systems, and information networks, which is important to the Department and the armed forces throughout the day-to-day operations, and in the time of crisis. The DIAP uses the OSD method to plan, observe, organize, and incorporate IA activities. The role of DIAP is to act as a facilitator for program execution by the combatant commanders, Military Services, and Defense Agencies. The DIAP staff combines functional and programmatic skills for a comprehensive Defense-wide approach to IA. The DIAP's main objective is to ensure that the DoD's vital information resources are secured and protected by incorporating IA activities to get a secure net-centric GIG operation enablement and information supremacy by applying a Defense-in-Depth methodology that integrates the capabilities of people, operations, and technology to establish a multi-layer, multidimensional protection.

NEW QUESTION 154

Which of the following is an open source network intrusion detection system?

- A. NETSH
- B. Macof
- C. Sourcefire
- D. Snort

Answer: D

Explanation:

Snort is an open source network intrusion prevention and detection system that operates as a network sniffer. It logs activities of the network that is matched with the predefined signatures. Signatures can be designed for a wide range of traffic, including Internet Protocol (IP), Transmission Control Protocol (TCP), User Datagram Protocol (UDP), and Internet Control Message Protocol (ICMP). The three main modes in which Snort can be configured are as follows:

Sniffer mode: It reads the packets of the network and displays them in a continuous stream on the console. Packet logger mode: It logs the packets to the disk.

Network intrusion detection mode: It is the most complex and configurable configuration, allowing Snort to analyze network traffic for matches against a user-defined rule set. Answer B is incorrect. Macof is a tool of the dsniiff tool set and used to flood the local network with random MAC addresses. It causes some switches to fail open in repeating mode, and facilitates sniffing. Answer C is incorrect. Sourcefire is the company that owns and maintains Snort. Answer A is incorrect. NETSH is not a network intrusion detection system. NETSH is a command line tool to configure TCP/IP settings such as the IP address, Subnet Mask, Default Gateway, DNS, WINS addresses, etc.

NEW QUESTION 155

You work as a security manager for BlueWell Inc. You are going through the NIST SP 800- 37 C&A methodology, which is based on four well defined phases. In which of the following phases of NIST SP 800-37 C&A methodology does the security categorization occur?

- A. Security Accreditation
- B. Security Certification
- C. Continuous Monitoring
- D. Initiation

Answer: D

Explanation:

The various phases of NIST SP 800-37 C&A are as follows: Phase 1: Initiation- This phase includes preparation, notification and resource identification. It performs the security plan analysis, update, and acceptance. Phase 2: Security Certification- The Security certification phase evaluates the controls and documentation. Phase 3: Security Accreditation- The security accreditation phase examines the residual risk for acceptability, and prepares the final security accreditation package. Phase 4: Continuous Monitoring-This phase monitors the configuration management and control, ongoing security control verification, and status reporting and documentation.

NEW QUESTION 156

You are the project manager of QSL project for your organization. You are working with your project team and several key stakeholders to create a diagram that shows how various elements of a system interrelate and the mechanism of causation within the system. What diagramming technique are you using as a part of the risk identification process?

- A. Cause and effect diagrams
- B. Influence diagrams
- C. Predecessor and successor diagramming
- D. System or process flowcharts

Answer: D

Explanation:

In this example you are using a system or process flowchart. These can help identify risks within the process flow, such as bottlenecks or redundancy. Answer A is incorrect. A cause and effect diagram, also known as an Ishikawa or fishbone diagram, can reveal causal factors to the effect to be solved. Answer B is incorrect. An influence diagram shows causal influences, time ordering of events and relationships among variables and outcomes. Answer C is incorrect. Predecessor and successor diagramming is not a valid risk identification term.

NEW QUESTION 160

You are advising a school district on disaster recovery plans. In case a disaster affects the main IT centers for the district they will need to be able to work from an alternate location. However, budget is an issue. Which of the following is most appropriate for this client?

- A. Cold site
- B. Off site
- C. Warm site
- D. Hot site

Answer: A

Explanation:

A cold site provides an office space, and in some cases basic equipment. However, you will need to restore your data to that equipment in order to use it. This is a much less expensive solution than the hot site. Answer D is incorrect. A hot site has equipment installed, configured and ready to use. This may make disaster recovery much faster, but will also be more expensive. And a school district can afford to be down for several hours before resuming IT operations, so the less expensive option is more appropriate. Answer C is incorrect. A warm site is between a hot and cold site. It has some equipment ready and connectivity ready. However, it is still significantly more expensive than a cold site, and not necessary for this scenario. Answer B is incorrect. Off site is not any type of backup site terminology.

NEW QUESTION 163

Fill in the blank with the appropriate security mechanism. _____ is a computer hardware mechanism or programming language construct which handles the occurrence of

exceptional events.

A. Exception handling

Answer: A

Explanation:

Exception handling is a computer hardware mechanism or programming language construct that handles the occurrence of events. These events occur during the software execution process and interrupt the instruction flow. Exception handling performs the specific activities for managing the exceptional events.

NEW QUESTION 166

DIACAP applies to the acquisition, operation, and sustainment of any DoD system that collects, stores, transmits, or processes unclassified or classified information since December 1997. What phases are identified by DIACAP? Each correct answer represents a complete solution. Choose all that apply.

- A. System Definition
- B. Validation
- C. Identification
- D. Accreditation
- E. Verification
- F. Re-Accreditation

Answer: ABEF

Explanation:

The Department of Defense Information Assurance Certification and Accreditation Process (DIACAP) is a process defined by the United States Department of Defense (DoD) for managing risk. DIACAP replaced the former process, known as DITSCAP (Department of Defense Information Technology Security Certification and Accreditation Process), in 2006. DoD Instruction (DoDI) 8510.01 establishes a standard DoD-wide process with a set of activities, general tasks, and a management structure to certify and accredit an Automated Information System (AIS) that will maintain the Information Assurance (IA) posture of the Defense Information Infrastructure (DII) throughout the system's life cycle. DIACAP applies to the acquisition, operation, and sustainment of any DoD system that collects, stores, transmits, or processes unclassified or classified information since December 1997. It identifies four phases: * 1.System Definition 2.Verification 3.Validation 4.Re-Accreditation

NEW QUESTION 168

Which of the following refers to a process that is used for implementing information security?

- A. Classic information security model
- B. Five Pillars model
- C. Certification and Accreditation (C&A)
- D. Information Assurance (IA)

Answer: C

Explanation:

Certification and Accreditation (C&A or CnA) is a process for implementing information security. It is a systematic procedure for evaluating, describing, testing, and authorizing systems prior to or after a system is in operation. The C&A process is used extensively in the U.S. Federal Government. Some C&A processes include FISMA, NIACAP, DIACAP, and DCID 6/3. Certification is a comprehensive assessment of the management, operational, and technical security controls in an information system, made in support of security accreditation, to determine the extent to which the controls are implemented correctly, operating as intended, and producing the desired outcome with respect to meeting the security requirements for the system. Accreditation is the official management decision given by a senior agency official to authorize operation of an information system and to explicitly accept the risk to agency operations (including mission, functions, image, or reputation), agency assets, or individuals, based on the implementation of an agreed-upon set of security controls. Answer D is incorrect. Information Assurance (IA) is the practice of managing risks related to the use, processing, storage, and transmission of information or data and the systems and processes used for those purposes. While focused dominantly on information in digital form, the full range of IA encompasses not only digital but also analog or physical form. Information assurance as a field has grown from the practice of information security, which in turn grew out of practices and procedures of computer security. Answer A is incorrect. The classic information security model is used in the practice of Information Assurance (IA) to define assurance requirements. The classic information security model, also called the CIA Triad, addresses three attributes of information and information systems, confidentiality, integrity, and availability. This C-I-A model is extremely useful for teaching introductory and basic concepts of information security and assurance; the initials are an easy mnemonic to remember, and when properly understood, can prompt systems designers and users to address the most pressing aspects of assurance. Answer B is incorrect. The Five Pillars model is used in the practice of Information Assurance (IA) to define assurance requirements. It was promulgated by the U.S. Department of Defense (DoD) in a variety of publications, beginning with the National Information Assurance Glossary, Committee on National Security Systems Instruction CNSSI-4009. Here is the definition from that publication: "Measures that protect and defend information and information systems by ensuring their availability, integrity, authentication, confidentiality, and non-repudiation. These measures include providing for restoration of information systems by incorporating protection, detection, and reaction capabilities." The Five Pillars model is sometimes criticized because authentication and non-repudiation are not attributes of information or systems; rather, they are procedures or methods useful to assure the integrity and authenticity of information, and to protect the confidentiality of the same.

NEW QUESTION 169

Martha works as a Project Leader for BlueWell Inc. She and her team have developed accounting software. The software was performing well. Recently, the software has been modified. The users of this software are now complaining about the software not working properly. Which of the following actions will she take to test the software?

- A. Perform integration testing
- B. Perform regression testing
- C. Perform unit testing
- D. Perform acceptance testing

Answer: B

Explanation:

Regression testing can be performed any time when a program needs to be modified either to add a feature or to fix an error. It is a process of repeating Unit testing and Integration testing whenever existing tests need to be performed again along with the new tests. Regression testing is performed to ensure that no existing errors reappear, and no new errors are introduced. Answer D is incorrect. The acceptance testing is performed on the application before its

implementation into the production environment. It is done either by a client or an application specialist to ensure that the software meets the requirement for which it was made. Answer A is incorrect. Integration testing is a logical extension of unit testing. It is performed to identify the problems that occur when two or more units are combined into a component. During integration testing, a developer combines two units that have already been tested into a component, and tests the interface between the two units. Although integration testing can be performed in various ways, the following three approaches are generally used: The top-down approach The bottom-up approach The umbrella approach Answer B is incorrect. Unit testing is a type of testing in which each independent unit of an application is tested separately. During unit testing, a developer takes the smallest unit of an application, isolates it from the rest of the application code, and tests it to determine whether it works as expected. Unit testing is performed before integrating these independent units into modules. The most common approach to unit testing requires drivers and stubs to be written. Drivers and stubs are programs. A driver simulates a calling unit, and a stub simulates a called unit.

NEW QUESTION 174

What are the subordinate tasks of the Implement and Validate Assigned IA Control phase in the DIACAP process? Each correct answer represents a complete solution. Choose all that apply.

- A. Conduct validation activities.
- B. Execute and update IA implementation plan.
- C. Combine validation results in DIACAP scorecard.
- D. Conduct activities related to the disposition of the system data and objects.

Answer: ABC

Explanation:

The Department of Defense Information Assurance Certification and Accreditation Process (DIACAP) is a process defined by the United States Department of Defense (DoD) for managing risk. The subordinate tasks of the Implement and Validate Assigned IA Control phase in the DIACAP process are as follows: Execute and update IA implementation plan. Conduct validation activities. Combine validation results in the DIACAP scorecard. Answer D is incorrect. The activities related to the disposition of the system data and objects are conducted in the fifth phase of the DIACAP process. The fifth phase of the DIACAP process is known as Decommission System.

NEW QUESTION 176

Which of the following terms ensures that no intentional or unintentional unauthorized modification is made to data?

- A. Non-repudiation
- B. Integrity
- C. Authentication
- D. Confidentiality

Answer: B

Explanation:

Integrity ensures that no intentional or unintentional unauthorized modification is made to data. Answer D is incorrect. Confidentiality refers to the protection of data against unauthorized access. Administrators can provide confidentiality by encrypting data. Answer A is incorrect. Non-repudiation is a mechanism to prove that the sender really sent this message. Answer B is incorrect. Authentication is the process of verifying the identity of a person or network host.

NEW QUESTION 180

Which of the following security models dictates that subjects can only access objects through applications?

- A. Biba model
- B. Bell-LaPadula
- C. Clark-Wilson
- D. Biba-Clark model

Answer: C

Explanation:

The Clark-Wilson security model dictates that subjects can only access objects through applications. Answer A is incorrect. The Biba model does not let subjects write to objects at a higher integrity level. Answer B is incorrect. The Bell-LaPadula model has a simple security rule, which means a subject cannot read data from a higher level. Answer D is incorrect. There is no such model as Biba-Clark model.

NEW QUESTION 184

Which of the following specifies access privileges to a collection of resources by using the URL mapping?

- A. Code Access Security
- B. Security constraint
- C. Configuration Management
- D. Access Management

Answer: B

Explanation:

Security constraint is a type of declarative security, which specifies the protection of web content. It also specifies access privileges to a collection of resources by using the URL mapping. A deployment descriptor is used to define the security constraint. Security constraint includes the following elements: Web resource collection Authorization constraint User data constraint Answer A is incorrect. Code Access Security (CAS), in the Microsoft .NET framework, is Microsoft's solution to prevent untrusted code from performing privileged actions. When the CLR (common language runtime) loads an assembly it will obtain evidence for the assembly and use this to identify the code group that the assembly belongs to. A code group contains a permission set (one or more permissions). Code that performs a privileged action will perform a code access demand, which will cause the CLR to walk up the call stack and examine the permission set granted to the assembly of each method in the call stack. The code groups and permission sets are determined by the administrator of the machine who defines the security policy. Answer D is incorrect. Access Management is used to grant authorized users the right to use a service, while preventing access to non-authorized users. The Access Management process essentially executes policies defined in IT Security Management. It is sometimes also referred to as Rights Management or Identity Management. It is part of Service Operation and the owner of Access Management is the Access Manager. Access Management is added as a new process to ITIL V3. The sub-processes of Access Management are as follows: Maintain Catalogue of User Roles and Access Profiles Manage User Access

Requests Answer B is incorrect. Configuration Management (CM) is an Information Technology Infrastructure Library (ITIL) IT Service Management (ITSM) process. It tracks all of the individual Configuration Items (CI) in an IT system, which may be as simple as a single server, or as complex as the entire IT department. In large organizations a configuration manager may be appointed to oversee and manage the CM process.

NEW QUESTION 188

Which of the following authentication methods is used to access public areas of a Web site?

- A. Anonymous authentication
- B. Biometrics authentication
- C. Mutual authentication
- D. Multi-factor authentication

Answer: A

Explanation:

Anonymous authentication is an authentication method used for Internet communication. It provides limited access to specific public folders and directory information or public areas of a Web site. It is supported by all clients and is used to access unsecured content in public folders. An administrator must create a user account in IIS to enable the user to connect anonymously. Answer D is incorrect. Multi-factor authentication involves a combination of multiple methods of authentication. For example, an authentication method that uses smart cards as well as usernames and passwords can be referred to as multi-factor authentication. Answer B is incorrect. Mutual authentication is a process in which a client process and server are required to prove their identities to each other before performing any application function. The client and server identities can be verified through a trusted third party and use shared secrets as in the case of Kerberos v5.

The MS-CHAP v2 and EAP-TLS authentication methods support mutual authentication. Answer B is incorrect. Biometrics authentication uses physical characteristics, such as fingerprints, scars, retinal patterns, and other forms of biophysical qualities to identify a user.

NEW QUESTION 189

You are responsible for network and information security at a large hospital. It is a significant concern that any change to any patient record can be easily traced back to the person who made that change. What is this called?

- A. Availability
- B. Confidentiality
- C. Non repudiation
- D. Data Protection

Answer: C

Explanation:

Non repudiation refers to mechanisms that prevent a party from falsely denying involvement in some data transaction.

NEW QUESTION 194

Which of the following SDLC phases consists of the given security controls: Misuse Case Modeling Security Design and Architecture Review Threat and Risk Modeling Security Requirements and Test Cases Generation?

- A. Deployment
- B. Requirements Gathering
- C. Maintenance
- D. Design

Answer: D

Explanation:

The various security controls in the SDLC design phase are as follows: Misuse Case Modeling: It is important that the inverse of the misuse cases be modeled to understand and address the security aspects of the software. The requirements traceability matrix can be used to track the misuse cases to the functionality of the software. Security Design and Architecture Review: This control can be introduced when the teams are engaged in the "functional" design and architecture review of the software. Threat and Risk Modeling: Threat modeling determines the attack surface of the software by examining its functionality for trust boundaries, data flow, entry points, and exit points. Risk modeling is performed by ranking the threats as they pertain to the users organization's business objectives, compliance and regulatory requirements and security exposures. Security Requirements and Test Cases Generation: All the above three security controls, i.e., Misuse Case Modeling, Security Design and Architecture Review, and Threat and Risk Modeling are used to produce the security requirements.

NEW QUESTION 196

Which of the following vulnerabilities occurs when an application directly uses or concatenates potentially hostile input with data file or stream functions?

- A. Insecure cryptographic storage
- B. Malicious file execution
- C. Insecure communication
- D. Injection flaw

Answer: B

Explanation:

Malicious file execution is a vulnerability that occurs when an application directly uses or concatenates potentially hostile input with data file or stream functions. This leads to arbitrary remote and hostile data being included, processed, and invoked by the Web server. Malicious file execution can be prevented by using an indirect object reference map, input validation, or explicit taint checking mechanism. Answer D is incorrect. Injection flaw occurs when data is sent to an interpreter as a part of command or query. Answer A is incorrect. Insecure cryptographic storage occurs when applications have failed to encrypt data. Answer B is incorrect. Insecure communication occurs when applications have failed to encrypt network traffic.

NEW QUESTION 199

Which of the following are the levels of public or commercial data classification system? Each correct answer represents a complete solution. Choose all that

apply.

- A. Sensitive
- B. Private
- C. Unclassified
- D. Confidential
- E. Secret
- F. Public

Answer: ABDF

Explanation:

The public or commercial data classification is also built upon a four-level model, which are as follows: Public Sensitive Private Confidential Each level (top to bottom) represents an increasing level of sensitivity. The public level is similar to unclassified level military classification system. This level of data should not cause any damage if disclosed. Sensitive is a higher level of classification than public level data. This level of data requires a greater level of protection to maintain confidentiality. The Private level of data is intended for company use only. Disclosure of this level of data can damage the company. The Confidential level of data is considered very sensitive and is intended for internal use only. Disclosure of this level of data can cause serious damage to the company. Answer C and E are incorrect. Unclassified and secret are the levels of military data classification.

NEW QUESTION 201

An attacker exploits actual code of an application and uses a security hole to carry out an attack before the application vendor knows about the vulnerability. Which of the following types of attack is this?

- A. Replay
- B. Zero-day
- C. Man-in-the-middle
- D. Denial-of-Service

Answer: B

Explanation:

A zero-day attack, also known as zero-hour attack, is a computer threat that tries to exploit computer application vulnerabilities which are unknown to others, undisclosed to the software vendor, or for which no security fix is available. Zero-day exploits (actual code that can use a security hole to carry out an attack) are used or shared by attackers before the software vendor knows about the vulnerability. User awareness training is the most effective technique to mitigate such attacks. Answer A is incorrect. A replay attack is a type of attack in which attackers capture packets containing passwords or digital signatures whenever packets pass between two hosts on a network. In an attempt to obtain an authenticated connection, the attackers then resend the captured packet to the system. In this type of attack, the attacker does not know the actual password, but can simply replay the captured packet. Answer B is incorrect. Man-in-the-middle attacks occur when an attacker successfully inserts an intermediary software or program between two communicating hosts. The intermediary software or program allows attackers to listen to and modify the communication packets passing between the two hosts. The software intercepts the communication packets and then sends the information to the receiving host. The receiving host responds to the software, presuming it to be the legitimate client. Answer D is incorrect. A Denial-of-Service (DoS) attack is mounted with the objective of causing a negative impact on the performance of a computer or network. It is also known as network saturation attack or bandwidth consumption attack. Attackers perform DoS attacks by sending a large number of protocol packets to a network.

NEW QUESTION 202

Which of the following types of obfuscation transformation increases the difficulty for a de-obfuscation tool so that it cannot extract the true application from the obfuscated version?

- A. Preventive transformation
- B. Data obfuscation
- C. Control obfuscation
- D. Layout obfuscation

Answer: A

Explanation:

Preventive transformation increases the difficulty for a de-obfuscation tool so that it cannot extract the true application from the obfuscated version.

NEW QUESTION 207

Which of the following statements about the authentication concept of information security management is true?

- A. It establishes the users' identity and ensures that the users are who they say they are.
- B. It ensures the reliable and timely access to resources.
- C. It determines the actions and behaviors of a single individual within a system, and identifies that particular individual.
- D. It ensures that modifications are not made to data by unauthorized personnel or processes.

Answer: A

Explanation:

The concept of authentication establishes the users' identity and ensures that the users are who they say they are. Answer B is incorrect. The concept of availability ensures the reliable and timely access to data or resources. Answer D is incorrect. The concept of integrity ensures that modifications are not made to data by unauthorized personnel or processes. Answer B is incorrect. The concept of accountability determines the actions and behaviors of a single individual within a system, and identifies that particular individual.

NEW QUESTION 212

Which of the following are the initial steps required to perform a risk analysis process? Each correct answer represents a part of the solution. Choose three.

- A. Valuations of the critical assets in hard costs.
- B. Evaluate potential threats to the assets.
- C. Estimate the potential losses to assets by determining their value.

D. Establish the threats likelihood and regularity.

Answer: BCD

Explanation:

The main steps of performing risk analysis are as follows: Estimate the potential losses to the assets by determining their value. Evaluate the potential threats to the assets. Establish the threats probability and regularity. Answer A is incorrect. Valuations of the critical assets in hard costs is one of the final steps taken after performing the risk analysis.

NEW QUESTION 215

System Authorization is the risk management process. System Authorization Plan (SAP) is a comprehensive and uniform approach to the System Authorization Process. What are the different phases of System Authorization Plan? Each correct answer represents a part of the solution. Choose all that apply.

- A. Post-certification
- B. Post-Authorization
- C. Authorization
- D. Pre-certification
- E. Certification

Answer: BCDE

Explanation:

The creation of System Authorization Plan (SAP) is mandated by System Authorization. System Authorization Plan (SAP) is a comprehensive and uniform approach to the System Authorization Process. It consists of four phases: Phase 1 - Pre-certification Phase 2 - Certification Phase 3 - Authorization Phase 4 - Post-Authorization

NEW QUESTION 216

Which of the following security controls will you use for the deployment phase of the SDLC to build secure software? Each correct answer represents a complete solution. Choose all that apply.

- A. Change and Configuration Control
- B. Security Certification and Accreditation (C&A)
- C. Vulnerability Assessment and Penetration Testing
- D. Risk Adjustments

Answer: BCD

Explanation:

The various security controls in the SDLC deployment phase are as follows: Secure Installation: While performing any software installation, it should kept in mind that the security configuration of the environment should never be reduced. If it is reduced then security issues and overall risks can affect the environment. Vulnerability Assessment and Penetration Testing: Vulnerability assessments (VA) and penetration testing (PT) is used to determine the risk and attest to the strength of the software after it has been deployed. Security Certification and Accreditation (C&A): Security certification is the process used to ensure controls which are effectively implemented through established verification techniques and procedures, giving organization officials confidence that the appropriate safeguards and countermeasures are in place as means of protection. Accreditation is the provisioning of the necessary security authorization by a senior organization official to process, store, or transmit information. Risk Adjustments: Contingency plans and exceptions should be generated so that the residual risk be above the acceptable threshold.

NEW QUESTION 217

At which of the following levels of robustness in DRM must the security functions be immune to widely available tools and specialized tools and resistant to professional tools?

- A. Level 2
- B. Level 4
- C. Level 1
- D. Level 3

Answer: C

Explanation:

At Level 1 of robustness in DRM, the security functions must be immune to widely available tools and specialized tools and resistant to professional tools.

NEW QUESTION 219

Which of the following security models characterizes the rights of each subject with respect to every object in the computer system?

- A. Clark-Wilson model
- B. Bell-LaPadula model
- C. Biba model
- D. Access matrix

Answer: D

Explanation:

The access matrix or access control matrix is an abstract, formal security model of protection state in computer systems that characterizes the rights of each subject with respect to every object in the system. It was first introduced by Butler W. Lampson in 1971. According to the access matrix model, the protection state of a computer system can be abstracted as a set of objects 'O', that is the set of entities that needs to be protected (e.g. processes, files, memory pages) and a set of subjects 'S' that consists of all active entities (e.g. users, processes). Further there exists a set of rights 'R' of the form $r(s,o)$, where $s \in S$, $o \in O$ and $r(s,o) \in R$. A right thereby specifies the kind of access a subject is allowed to process with regard to an object. Answer B is incorrect. The Bell-La Padula Model is a state machine model used for enforcing access control in government and military applications. The model is a formal state transition model of computer security policy that

describes a set of access control rules which use security labels on objects and clearances for subjects. Security labels range from the most sensitive (e.g., "Top Secret"), down to the least sensitive (e.g., "Unclassified" or "Public"). The Bell-La Padula model focuses on data confidentiality and controlled access to classified information, in contrast to the Biba Integrity Model which describes rules for the protection of data integrity. Answer A is incorrect. The Clark-Wilson model provides a foundation for specifying and analyzing an integrity policy for a computing system. The model is primarily concerned with formalizing the notion of information integrity. Information integrity is maintained by preventing corruption of data items in a system due to either error or malicious intent. The model's enforcement and certification rules define data items and processes that provide the basis for an integrity policy. The core of the model is based on the notion of a transaction. Answer B is incorrect. The Biba model is a formal state transition system of computer security policy that describes a set of access control rules designed to ensure data integrity. Data and subjects are grouped into ordered levels of integrity. The model is designed so that subjects may not corrupt data in a level ranked higher than the subject, or be corrupted by data from a lower level than the subject.

NEW QUESTION 221

Which of the following is a standard that sets basic requirements for assessing the effectiveness of computer security controls built into a computer system?

- A. FITSAF
- B. FIPS
- C. TCSEC
- D. SSAA

Answer: C

Explanation:

Trusted Computer System Evaluation Criteria (TCSEC) is a United States Government Department of Defense (DoD) standard that sets basic requirements for assessing the effectiveness of computer security controls built into a computer system. TCSEC was used to evaluate, classify, and select computer systems being considered for the processing, storage, and retrieval of sensitive or classified information. It was replaced with the development of the Common Criteria international standard originally published in 2005. The TCSEC, frequently referred to as the Orange Book, is the centerpiece of the DoD Rainbow Series publications. Answer D is incorrect. System Security Authorization Agreement (SSAA) is an information security document used in the United States Department of Defense (DoD) to describe and accredit networks and systems. The SSAA is part of the Department of Defense Information Technology Security Certification and Accreditation Process, or DITSCAP (superseded by DIACAP). The DoD instruction (issues in December 1997, that describes DITSCAP and provides an outline for the SSAA document is DODI 5200.40. The DITSCAP application manual (DoD 8510.1- M), published in July 2000, provides additional details. Answer A is incorrect. FITSAF stands for Federal Information Technology Security Assessment Framework. It is a methodology for assessing the security of information systems. It provides an approach for federal agencies. It determines how federal agencies are meeting existing policy and establish goals. The main advantage of FITSAF is that it addresses the requirements of Office of Management and Budget (OMB). It also addresses the guidelines provided by the National Institute of Standards and Technology (NIST). Answer B is incorrect. The Federal Information Processing Standards (FIPS) are publicly announced standards developed by the United States federal government for use by all non-military government agencies and by government contractors. Many FIPS standards are modified versions of standards used in the wider community (ANSI, IEEE, ISO, etc.). Some FIPS standards were originally developed by the U.S. government. For instance, standards for encoding data (e.g., country codes), but more significantly some encryption standards, such as the Data Encryption Standard (FIPS 46-3) and the Advanced Encryption Standard (FIPS 197). In 1994, NOAA (Noaa) began broadcasting coded signals called FIPS (Federal Information Processing System) codes along with their standard weather broadcasts from local stations. These codes identify the type of emergency and the specific geographic area (such as a county) affected by the emergency.

NEW QUESTION 226

Which of the following policies can explain how the company interacts with partners, the company's goals and mission, and a general reporting structure in different situations?

- A. Informative
- B. Advisory
- C. Selective
- D. Regulatory

Answer: A

Explanation:

An informative policy informs employees about certain topics. It is not an enforceable policy, but rather one to teach individuals about specific issues relevant to the company. The informative policy can explain how the company interacts with partners, the company's goals and mission, and a general reporting structure in different situations. Answer D is incorrect. A regulatory policy ensures that an organization follows the standards set by specific industry regulations. This type of policy is very detailed and specific to a type of industry. The regulatory policy is used in financial institutions, health care facilities, public utilities, and other government-regulated industries, e.g., TRAI. Answer B is incorrect. An advisory policy strongly advises employees regarding which types of behaviors and activities should and should not take place within the organization. It also outlines possible ramifications if employees do not comply with the established behaviors and activities. The advisory policy can be used to describe how to handle medical information, handle financial transactions, and process confidential information. Answer B is incorrect. It is not a valid type of policy.

NEW QUESTION 230

What are the security advantages of virtualization, as described in the NIST Information Security and Privacy Advisory Board (ISPAB) paper "Perspectives on Cloud Computing and Standards"? Each correct answer represents a complete solution. Choose three.

- A. It increases capabilities for fault tolerant computing.
- B. It adds a layer of security for defense-in-depth.
- C. It decreases exposure of weak software.
- D. It decreases configuration effort.

Answer: ABC

Explanation:

The security advantages of virtualization are as follows: It adds a layer of security for defense-in-depth. It provides strong encapsulation of errors. It increases intrusion detection through introspection. It decreases exposure of weak software. It increases the flexibility for discovery. It increases capabilities for fault tolerant computing using rollback and snapshot features. Answer D is incorrect. Virtualization increases configuration effort because of complexity of the virtualization layer and composite system.

NEW QUESTION 233

Which of the following is an example of penetration testing?

- A. Implementing NIDS on a network
- B. Implementing HIDS on a computer
- C. Simulating an actual attack on a network
- D. Configuring firewall to block unauthorized traffic

Answer: C

Explanation:

Penetration testing is a method of evaluating the security of a computer system or network by simulating an attack from a malicious source, known as a Black Hat Hacker, or Cracker. The process involves an active analysis of the system for any potential vulnerabilities that may result from poor or improper system configuration, known and/or unknown hardware or software flaws, or operational weaknesses in process or technical countermeasures. This analysis is carried out from the position of a potential attacker, and can involve active exploitation of security vulnerabilities. Any security issues that are found will be presented to the system owner together with an assessment of their impact and often with a proposal for mitigation or a technical solution. The intent of a penetration testing is to determine feasibility of an attack and the amount of business impact of a successful exploit, if discovered. It is a component of a full security audit. Answer A, B, and D are incorrect. Implementing NIDS and HIDS and configuring firewall to block unauthorized traffic are not examples of penetration testing.

NEW QUESTION 235

Billy is the project manager of the HAR Project and is in month six of the project. The project is scheduled to last for 18 months. Management asks Billy how often the project team is participating in risk reassessment in this project. What should Billy tell management if he's following the best practices for risk management?

- A. Project risk management happens at every milestone.
- B. Project risk management has been concluded with the project planning.
- C. Project risk management is scheduled for every month in the 18-month project.
- D. At every status meeting the project team project risk management is an agenda item.

Answer: D

Explanation:

Risk management is an ongoing project activity. It should be an agenda item at every project status meeting. Answer A is incorrect. Milestones are good times to do reviews, but risk management should happen frequently. Answer B is incorrect. This answer would only be correct if the project has a status meeting just once per month in the project. Answer B is incorrect. Risk management happens throughout the project as does project planning.

NEW QUESTION 239

Which of the following strategies is used to minimize the effects of a disruptive event on a company, and is created to prevent interruptions to normal business activity?

- A. Continuity of Operations Plan
- B. Contingency Plan
- C. Disaster Recovery Plan
- D. Business Continuity Plan

Answer: D

Explanation:

BCP is a strategy to minimize the consequence of the instability and to allow for the continuation of business processes. The goal of BCP is to minimize the effects of a disruptive event on a company, and is formed to avoid interruptions to normal business activity. Business Continuity Planning (BCP) is the creation and validation of a practiced logistical plan for how an organization will recover and restore partially or completely interrupted critical (urgent) functions within a predetermined time after a disaster or extended disruption. The logistical plan is called a business continuity plan. Answer B is incorrect. A contingency plan is a plan devised for a specific situation when things could go wrong. Contingency plans are often devised by governments or businesses who want to be prepared for anything that could happen. Contingency plans include specific strategies and actions to deal with specific variances to assumptions resulting in a particular problem, emergency, or state of affairs. They also include a monitoring process and "triggers" for initiating planned actions. They are required to help governments, businesses, or individuals to recover from serious incidents in the minimum time with minimum cost and disruption. Answer B is incorrect. Disaster recovery planning is a subset of a larger process known as business continuity planning and should include planning for resumption of applications, data, hardware, communications (such as networking), and other IT infrastructure. A business continuity plan (BCP) includes planning for non-IT related aspects such as key personnel, facilities, crisis communication, and reputation protection, and should refer to the disaster recovery plan (DRP) for IT-related infrastructure recovery/continuity. Answer A is incorrect. The Continuity Of Operation Plan (COOP) refers to the preparations and institutions maintained by the United States government, providing survival of federal government operations in the case of catastrophic events. It provides procedures and capabilities to sustain an organization's essential. COOP is the procedure documented to ensure persistent critical operations throughout any period where normal operations are unattainable.

NEW QUESTION 244

Digital rights management (DRM) consists of compliance and robustness rules. Which of the following features does the robustness rule have? Each correct answer represents a complete solution. Choose three.

- A. It specifies the various levels of robustness that are needed for asset security.
- B. It specifies minimum techniques for asset security.
- C. It specifies the behaviors of the DRM implementation and applications accessing the implementation.
- D. It contains assets, such as device key, content key, algorithm, and profiling data.

Answer: ABD

Explanation:

The DRM (digital rights management) technology includes the following rules: 1.Compliance rule: This rule specifies the behaviors of the DRM implementation, and applications that are accessing the implementation. The compliance rule specifies the following elements: Definition of specific license rights Device requirements Revocation of license path or penalties when the implementation is not robust enough or noncompliant 2.Robustness rule: This rule has the following features: It specifies the various levels of robustness that are needed for asset security. It contains assets, such as device key, content key, algorithm, and profiling data. It specifies minimum techniques for asset security.
